Did you know data privacy attacks occur every 40 seconds in the U.S.? Not just large companies, but any business that store data on a network is at risk of a cyber attack. In fact, 85% of Data breach insurance claims come from small-to mid-sized businesses, and more that 60% of those businesses never recover from a data breach. The risks are higher than ever due to the most companies working from home or a hybrid environment because of the pandemic. Understanding how to protect your business is necessary for any employer.

HUB International has partnered with Steady Networks on this presentation to discuss different types of cyber breaches and how you can protect your business from them.

In this webinar you will learn:

- Real world examples of cyber-breaches and what would have prevented them
- The top five cyber defense tactics for businesses
- What cyber insurance does and does not do for your business
